Tweet: The CDC's provisional count of overdose deaths suggests drug deaths are leveling off with 109,680 in 2022, compared to 109,179 in 2021. Synthetic opioids (mostly fentanyl) accounted for 75,217 deaths. effectively unchanged since 2021.

Summary: The Centers for Disease Control and Prevention on Wednesday released a provisional count of overdose deaths last year that indicated the toll of the fentanyl crisis leveling off after two years of surges during the Covid-19 pandemic. The CDC counted 109,680 overdose deaths in 2022 compared with 109,179 deaths from a similar 2021 projection. "It's hard to know for sure where it will end up, but it will be essentially flat," said Dr. Robert Anderson, chief of the mortality statistics branch at the CDC's National Center for Health Statistics. The plateau follows a 16% increase in overdose deaths in 2021 and a 30% surge in 2020. The U.S. has only recorded two years in which drug fatalities declined in the past several decades, 1990 and 2018.
