Tweet: Japan's National Institute of Population and Social Security Research projects that 42% of adult Japanese women may never have children at the higher end of their range.

Summary: 42% of adult Japanese women may end up never having children. In a more optimistic scenario, a quarter of women born in 2005 may end up not having offspring. The midpoint estimate by Japan's National Institute of Population and Social Security Research calls for a third of them not having children. The percentage of childlessness is even higher for men, with as many as 50% never seen having children, according to the report.
