**Tweet:** The World Meteorological Organization has assessed that global temperatures are likely to exceed 1.5C above pre-industrial levels within the next five years.

**Summary:** Global temperatures are likely to exceed 1.5C above pre-industrial levels for the first time in human history within the next five years, the World Meteorological Organization has said in its latest annual assessment. In a stark conclusion, scientists said for the first time there was a 66 per cent chance that the annual mean global surface temperature rise would temporarily surpass 1.5C above pre-industrial levels in “at least” one year by 2027. The chances of this outcome were also “increasing with time”, the report said. The assessment of a two-thirds chance of a temporary breach of the 1.5C threshold compares with estimates of around 48 per cent a year ago, and “close to zero” in 2015.
