Summary: We find substantial white flight from Asian students entering high-socioeconomic status suburban districts: on average, the arrival of one Asian student in a suburban school district leads to the departure of 1.5 white students, a rate of white flight that is somewhat lower but not too dissimilar from flight from Black/Hispanic. We find substantial white flight from Asian students entering high-socioeconomic status suburban districts: on average, the arrival of one Asian student in a suburban school district leads to the departure of 1.5 white students, a rate of white flight that is somewhat lower but not too dissimilar from flight from Black/Hispanic populations documented in different settings. Academic performance also rises with Asian entry to high-SES suburban districts. After ruling out correlated patterns of Black/Hispanic entry and direct racial animus, and confirming that housing market dynamics cannot account for the observed departure rate, we suggest that white flight from high-SES districts may be due to parental concerns about academic competition, particularly in a state like CA where entry to public colleges and universities is determined in part by relative high school performance. This pattern is consistent with qualitative sociological evidence about white-Asian encounters in suburban settings.
