Tweet: California snowpack is nearly double average levels for this time of year and the state is racing to try to capture the precipitation to offset the record drought. @wsj

Summary: California is nearing record precipitation this winter after the three driest years on record left reservoirs drained all over the state. Landowners along with state and local water managers are rushing to harvest as much runoff as they can before it escapes into the Pacific Ocean. Gov. Gavin Newsom in February ordered the state to accelerate its efforts to corral storm runoff, such as by facilitating projects to inject more water in underground aquifers. Los Angeles city officials say they have diverted 25 billion gallons so far this winter, or enough to meet the annual needs of 308,000 households. That was made possible partly by improvements such as deepening a group of pool-like basins in the San Fernando Valley so they could hold more rainwater. Runoff was also collected in streets that have been redesigned to include swales of open ground alongside to give water a place to seep underground.
