Tweet: [@LHSummers forecasts 10-year T-bills yielding an average of 4.75% over the next decade relative to an average of 2.9% over the last 20 years.](#)

Summary: Inflation is likely to trend at a faster pace than in the past, perhaps 2.5%. A real return, which could be 1.5% to 2% over time when thinking of the government's increasing borrowing needs — driven by the need for more defense spending, the likelihood of some Trump administration tax cuts getting extended, and higher average interest costs on outstanding debt. A term premium, which is the compensation investors get for buying a longer-term security rather than rolling over investments in short-term ones. Typically this has averaged about 0.75 to 1 percentage point. Adding up the three components, then it's likely investors over the next decade will be "looking at 4.75 on the 10-year — and it obviously could end up being higher than that."
