Author(s)	Olivier Blanchard
Publication	Peterson Institute for International Economics
Publication Date	January 24, 2023

Tweet: .@ojblanchard1 argues that the secular stagnation environment – where real interest rates were low, often negative, and much lower than the economy's rate of growth – will soon reassert itself and will then be the "prevalent regime for some time to come."

Summary: Summers has argued that the increase in public debt due to the fiscal response to COVID will lead, other things equal, to an increase in r [real return on capital]. He is right about the sign of the increase in public debt's impact on r , but the effect is likely to be quite small. The debt-to-GDP ratio in advanced economies has increased only from 75 percent in 2019 to 82 percent in 2022; under standard assumptions, this implies an increase in r of no more than 15–30 basis points. That would be insufficient to offset the pre-COVID downward trend in safe rates, let alone to close the gap between r and g [growth rate of output.]
