Tweet: Credit Suisse forecasts that the Inflation Reduction Act could generate investments of \$800B in public spending and another \$900B of private spending generated by loans and grants by 2031. @FinancialTimes

Summary: Last year's colossal Inflation Reduction Act [IRA] and its hundreds of billions of dollars in cleantech subsidies are designed to spur private-sector investment and accelerate the country's decarbonization effort. All told, the IRA offers \$369bn of tax credits, grants, loans, and subsidies, many of them guaranteed past 2030. The credits can be sold, too, allowing deep-pocketed investors with enough tax liability to buy the credit — a way to get more capital to developers, quickly. Credit Suisse thinks the public spending enabled by the IRA could eventually reach \$800bn, and \$1.7tn once the private spending generated by the loans and grants is included.
