Tweet: According to new Census Bureau projections, the US population will stop growing by 2080 at 370mm and start to shrink by 2100. Nigeria and Pakistan are expected to be more populous than the US around mid-century.

Summary: Slowing growth would produce a peak U.S. population of almost 370 million before an ebb to 366 million in the final years of the century, according to the bureau. The projections outline a nation growing slowly compared with recent decades. Annual growth rates have fallen from 1.2% in the 1990s to 0.5% today and would fall to 0.2% by 2040. Small differences add up through compounding: The projected U.S. population in 2040 is 355 million, 25 million fewer than projected for that date in 2015. The difference is more than the current population of Florida. In 2022, preliminary data showed the U.S. birthrate was about 19% lower than in 2007. Death rates remain about 9% higher than 2019, the last year before the pandemic. By 2038, deaths would exceed births under the most likely scenario.
