Tweet: Recent rain and snowfall in California have replenished reservoirs, helping the state better manage its long-term drought. @nytimes

Summary: Torrential rain and snow have again drenched California in recent weeks, amplifying an already wet winter season. The extreme precipitation has begun to ease the state's long-term drought, the driest three-year stretch on record. The recent storms have quickly refilled many of California's reservoirs. A number of them have returned to or even surpassed average levels for this time of year, compared with previous years where reservoir levels remained below the historical average.
