Tweet: Despite a growing long-term Federal deficit as a share of GDP, @greg_ip notes at 2.4% real Treasury yields are still lower than during the 1990s, when the U.S. government's debt level and deficits were significantly lower.

Summary: Most of the increase is due to the part of yields, called the term premium, which has nothing to do with inflation or short-term rates. Numerous factors affect the term premium, and rising government deficits are a prime suspect. Deficits have been wide for years. There's not much sign that this has yet imposed a penalty. Investors still project that the Fed will get inflation down to its 2% goal. At 2.4%, real (inflation-adjusted) Treasury yields are comparable to those in the mid-2000s and lower than in the 1990s, when the U.S. government's debts and deficits were much lower.
