Tweet: 2023 was the hottest September on record. The mean global temperature in September was 1.75°C warmer than the pre-industrial period.

Summary: Scientists at the Copernicus Climate Change Service said 2023 was on course to be the hottest on record, after the average global temperature in September was 1.75C degrees warmer than the pre-industrial period of 1850-1900 before human-induced climate change began to take effect. The monitoring service also found Antarctic sea ice levels remained at record lows for the time of year. Last month's global average temperature of 16.38C was 0.5C above the previous warmest September in 2020, it said, and 0.93C above the 1991-2020 average for the month.
