Tweet: [.@JBSay](#) notes there have been at least 400,000 unexpected deaths among the US working-age population since 2020. Netting out Covid deaths and unnatural deaths (homicide, suicide, overdose, etc.) he finds a spike starting in 2021.

Summary: In 2021 group life [insurance] payments exploded by 20.7% over the five-year average and by 15% over the acute pandemic year of 2020. If we remove both Covid-19 and unnatural deaths (homicide, suicide, overdose, etc.), we see a dramatic spike of natural, non-Covid-19 deaths among working-age people beginning in the spring and summer of 2021. To overgeneralize: In 2020, the vulnerable died of Covid at unusually high rates. In 2021 and 2022, Covid continued its assault, but the young, middle-aged, and healthy also died in aberrantly high numbers of something else.
