Tweet: [The Oswald Misery Index \(2 x unemployment + inflation \) was 15% in October, on par with the 20% peaks in the aftermath of the financial crisis. @WSJ](#)

Summary: Since the early 1990s, the Misery Index has only been higher during the 2007-09 recession and its aftermath and for a couple of months in 2020 during the early lockdowns. Importantly, though, the two factors didn't necessarily carry the same weight, as the Misery Index implies. [Andrew Oswald, a professor at the University of Warwick, found that] a 1-percentage-point increase in the unemployment rate had an equivalent impact on happiness as a 1.97-point increase in the inflation rate. [If Oswald] were to construct a Misery Index, he would make a simple modification: Multiply the unemployment rate by two and add it to the inflation rate. His index was 20% in 2010 and 15.1% now. By putting extra weight on unemployment, the index helps explain why 2010 was so much worse for Democrats.
