**Tweet:** China has reclaimed at least 170,000 hectares of land since 2021 as part of a campaign to gain self-sufficiency in food supplies. Currently, ¾ of Chinese soybean supply comes from the US and Brazil.

**Summary:** Xi Jinping said authorities must take “hard measures that grow teeth” to maintain 120mn hectares of cultivated land across the country — the level widely seen by Beijing as necessary to secure self-sufficiency. Authorities have reclaimed more than 170,000 hectares since 2021 as Beijing tries to reduce its reliance on imported food amid fears confrontation between China and the US could disrupt global supply chains. “China is preparing for the worst-case scenario in which it couldn’t buy any food from abroad”, said Yu Xiaohua, an agricultural economics professor at the University of Göttingen. “The authority is counting on the reclamation drive to improve the country’s grain self-sufficiency.”
