Tweet: [@jefflarrimore @kevincorinth](#) find that Millennials between the ages of 36-40 have 18% higher real median household incomes (net of taxes and transfers) than Generation X at the same age range and that Millennial' market incomes were 14% higher.

Summary: Each of the past four generations of Americans was better off than the previous one, using a post-tax, post-transfer income measure constructed annually from 1963-2022 based on the Current Population Survey Annual Social and Economic Supplement. At age 36–40, Millennials had a real median household income that was 18% higher than that of the previous generation at the same age. This rate of [post-tax and transfer] intergenerational progress was slower than that experienced by the Silent Generation (34%) and Baby Boomers (27%), but similar to that experienced by Generation X (16%). Slower progress for Generation X and Millennials is due to their stalled growth in work hours—holding work hours constant, they experienced a greater intergenerational increase in real market income than Baby Boomers. We also find that the higher educational costs incurred by younger generations is far outweighed by their lifetime income gains.
