Tweet: The Employment Cost Index is consistent with annualized 4% PCE inflation. Real wages are now 5% below their pre-pandemic trend. @Jasonfurman

Summary: The Employment Cost Index weighs in on the side of the argument that wage growth is not slowing--suggesting that the average hourly earnings slowdown was a spurious result of composition. Over the last six months, ECI went up at a 4.7% annual rate, consistent with 4.0% PCE inflation. The previous showed private wages excluding incentive occupations, probably the best measure. All the measures consistent. At an annual rate over the last 3 months: Private comp +4.7%; Private wages +4.9%; Private wages ex incentive+ 5.1%. All are higher than any time in the last cycle. This leaves real wages and salaries 5 percent below their pre-pandemic trend.
