**Tweet:** As of 2020, @NewYorkFed finds life and property and casualty insurance firms were well capitalized for the climate risk they are bearing.

**Summary:** Insurance companies can be exposed to climate-related physical risk through their operations and to transition risk through their \$12T of financial asset holdings. We assess the climate risk [CRISK] exposure of property and casualty [P&C] and life insurance companies in the U.S. In terms of transition risk for life insurers, we observe a notable increase in their transition climate beta during the 2019-20 fossil fuel price collapse. The aggregate transition CRISK for life insurers in the U.S. also significantly rose by more than \$ 150B, equivalent to around 28% of their market cap. Excluding concurrent undercapitalization, the marginal CRISK attributed solely to climate stress increased by more than \$ 85B during the same period. In terms of physical risk for P&C insurers, we find that the top ten P&C insurers mostly had negative CRISK values [excess reserves], indicating no sign of potential systemic under-capitalization under physical climate stress. As of the end of 2020, their aggregate marginal CRISK stood at \$15B, equivalent to approximately 7% of their market cap.
