Tweet: [. @TheEconomist estimates that between the pandemic, war and emigration Russia has lost more than 2m people relative to the pre-2020 baseline with the life expectancy of Russian males aged 15 falling by almost five years to the same level as Haiti.](#)

Summary: Over the past three years Russia has lost around 2m more people than it would ordinarily have done, as a result of war, disease and exodus. The life expectancy of Russian males aged 15 fell by almost five years, to the same level as in Haiti. The number of Russians born in April 2022 was no higher than it had been in the months of Hitler's occupation. And because so many men of fighting age are dead or in exile, women outnumber men by at least 10m. According to Western estimates, 175,000-200,000 Russian soldiers have been killed or wounded over the past year. Somewhere between 500,000 and 1m mostly young, educated people have evaded the meat grinder by fleeing abroad. If you add pandemic mortality to the casualties of war and the flight from mobilization, Russia lost between 1.9m and 2.8m people in 2020-23 on top of its normal demographic deterioration.
