Publication Date	June 10, 2024

Tweet: .@M_C_Klein notes that for the first four months of 2024, wage growth had moderated to 3.6%/year, near the pre-pandemic trend of 3.2%. An uptick in May and an upward revision for March call this moderation into question.

Summary: From the middle of 2022 through the end of 2023, the typical U.S. worker's wage consistently rose about 0.4% each month (4.9% annualized), compared to a pre-pandemic average growth rate of about 0.26% (3.2% annualized). By last month, however, it seemed that things might have changed, with wage growth in the first four months of 2024 remarkably close to the pre-pandemic average. [However,] the typical worker's average hourly pay jumped by 0.45% in May relative to April on a seasonally-adjusted basis, [and] at the same time, wage growth for March 2024 was revised up. As a result, the average monthly pay increase in 2024 has ticked up from 0.29% (as of last month's data) to 0.34%, or from 3.6% a year to 4.1%.
