**Tweet:** China is expected to add more legacy chipmaking capacity than the rest of the world combined in 2024, creating a risk that indigenous chipmaking efforts in India will be stillborn.

**Summary:** When India's largest conglomerate, Tata Group, broke ground on a \$11 billion semiconductor factory this week, Prime Minister Narendra Modi said the country was poised to become a world leader in the sector. He might be in for a rude awakening. China, is pouring capital into legacy chip making on a breathtaking scale. China will add more chip-making capacity than the rest of the world combined in 2024, according to research consulting firm Gavekal Dragonomics: one million more wafers a month than in 2023—all mature nodes. China's aggressive expansion comes at a time when the market for legacy chips is already well supplied. Utilization rates for producers of mature-node chips have fallen from nearly 100% in 2020 to 65-75% at present, according to Gavekal. China's government incentives—worth more than \$150 billion—will help producers absorb losses. But India would struggle to shower such a capital-intensive infant industry with that kind of cash, especially given its already high government debt and enormous funding needs for infrastructure in general.
